## 0.1 Metaprogramming Project

```
In [1]: macro \sim (y, ex)
          new_ex = Meta.quot(ex)
          quote
             inner_ex = \$(esc(new_ex))
             data_name = Symbol(string(inner_ex.args[end])[1])
             eval_ex = Expr(:(=),:data,data_name)
             eval(Main, eval_ex)
             new_X = Matrix{Float64}(size(data,1),length(inner_ex.args)-1)
             cur\_spot = 0
             for i in 2:length(inner_ex.args)
               if inner_ex.args[i] == 1
                 new_X[:,i-1] = ones(size(data,1))
               else
                 col = parse(Int, string(string(inner_ex.args[i])[2]))
                 new_X[:,i-1] = data[:,col]
               end
             end
             $(esc(y)), new_X
          end
        end
        y = rand(10)
        X = rand(10, 4)
        y \sim 1 + X1 + X2 + X4
        function solve_least_squares(y, X)
          X \setminus y
        solve_least_squares(tup::Tuple) = solve_least_squares(tup...)
        solve_least_squares(y~1+X1+X2+X4)
Out[1]: 4-element Array{Float64,1}:
          0.153788
          0.742984
         -0.268836
          0.320996
```

## 0.2 Distribution Dispatch Problem

This is from Josh Day's talk: https://www.youtube.com/watch?v=EwcTNzpQ6Sc Solution is from: https://github.com/joshday/Talks/blob/master/SLG2016\_IntroToJulia/Slides.ipynb

```
In []: function myquantile(d::UnivariateDistribution, q::Number) \theta = \text{mean}(d) \text{tol} = \text{Inf} \text{while tol} > 1\text{e}-5 \theta \text{old} = \theta \theta = \theta - (\text{cdf}(d, \theta) - q) / \text{pdf}(d, \theta) \text{tol} = \text{abs}(\theta \text{old} - \theta) \text{end} \theta \text{end} \theta \text{end} \theta \text{end} \theta \text{show myquantile}(\text{dist, .75}) \theta \text{show quantile}(\text{dist, .75}) \theta \text{println}() \text{end}
```
